PROJECT: Unique Password Generator GUI

INTRODUCTION:

The unique password generator is software tool that creates random or customized passwords for user. It helps to create strong passwords that provide good security for users.

ABSTRACT:

The tkinter module is used to create graphical user interface for the unique password generator project. The tkinter module has different options like rows, column, grids, buttons etc.

After creating the graphical user interface for the project we have to generate a strong random password for that we have created a function consists of operations for generating password like different sets consists of letters, numbers, symbols.

We randomly take some letters, numbers, symbols in given range and join them together so make it a single password.

After generating password we have an add option so that we can save the entered details in a text file after completion.
